

Super 8 hotel analytics

Data Sources

The analysis utilized performance metrics from 2023–2026. The primary analysis focused on 2023–2025 due to more complete datasets. 2026 data was included to inform April pricing recommendations.

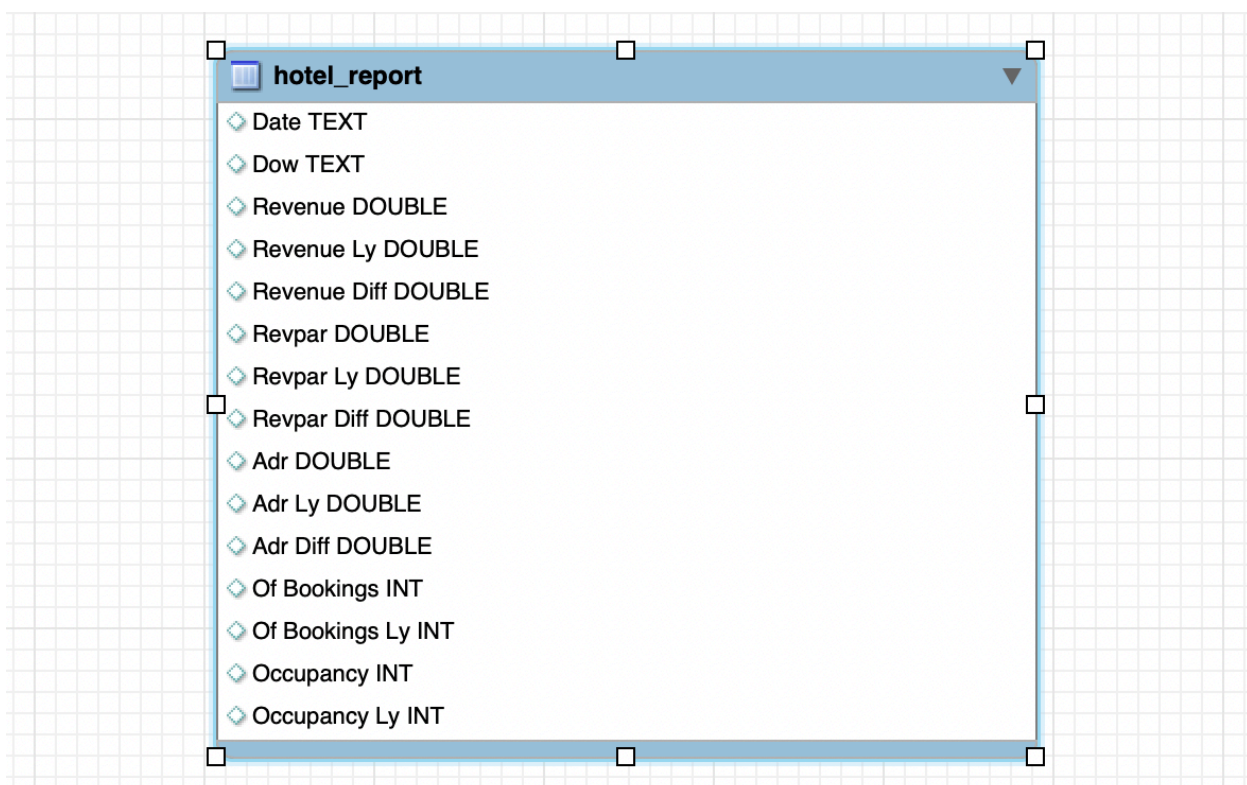

- When to raise prices in april peak
- Which price point resulted in the highest RevPar from 2023-2025 in April
- What price results in the highest occupancy and RevPar when the peak drops
- Identify which days in april do we see spikes in RevPar an Occ

Recommendations for april

- Follow the trend in 2023 regards the adr it shows the the highest occupancy and adr out of all years
- In April 2023 the spike in RevPar began to grow around the 10th. This shows evidence of demand during this period of time. I suggest a boost in ADR to match demand. This may help with increased revenue for this month and during the peak period in April

Executive Summary

Overview of findings

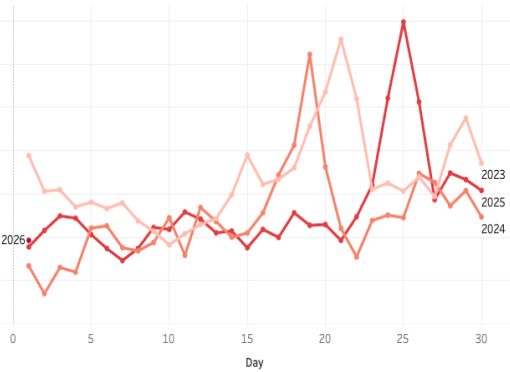

April 2023 recorded the highest average revenue across all weekdays, followed by a steep decline in 2024 and a slight recovery in 2025.

In 1.1, we analyze and compare RevPAR across April 2023–2025. A consistent pattern emerges: from mid-to-late April, there is a significant spike in RevPAR across all three years, accompanied by corresponding increases in both revenue and occupancy. The key differentiator is identifying which year produced the widest and highest spike — measured by the spread from when the spike begins (e.g. April 15) to when it ends (e.g. April 30).

Comparing the three years to find the optimal balance of high revenue, strong RevPAR, and longest duration — the "Goldilocks zone" — 2025 shows the highest peak but the shortest spread. 2024 shows the lowest peak with a spread comparable to 2025. This makes 2023 the strongest benchmark, offering the best combination of peak height and sustained duration.

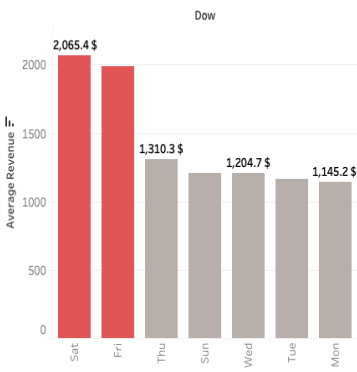

Revpar 2023-2026

Here we see that 2023 has the earliest exponential growth and longest peak. I recommend following rates similar to this year. 2025 has the highest peak and 2024 has the lowest

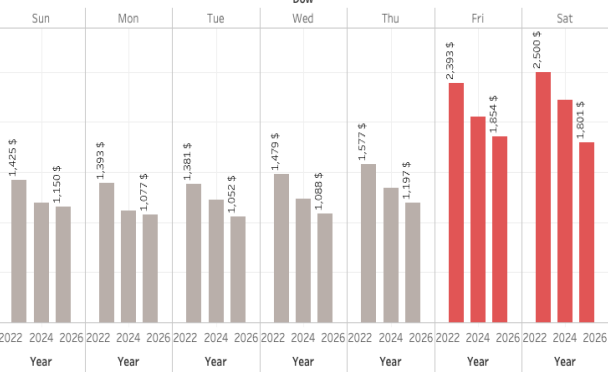

Average Revenue Across 2023 - 2026

Here we see across all years that Saturday and Friday are the best performing days

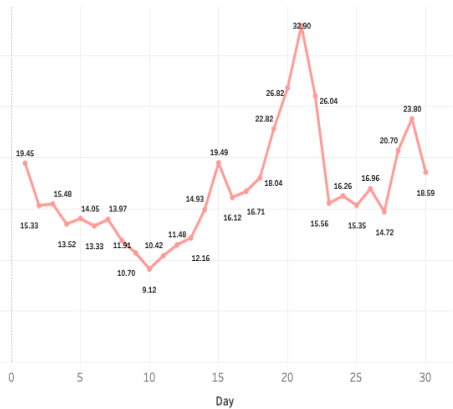

Average Daily Revenue Comparisson

When broken down by year we again see that Friday and Saturday are consistently the most performant

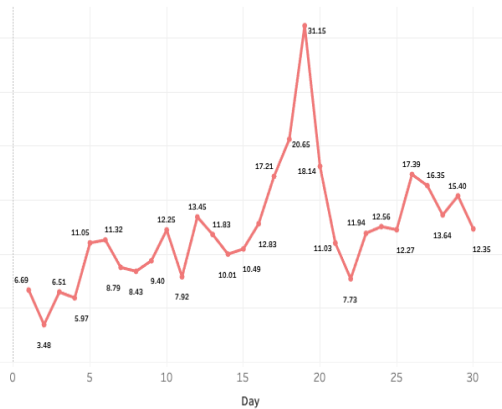

Revpar 2023

Exponential growth starting the 10th and ending the 21st

Revpar 2024

Exponential starting the 14th and peaking the 19th

Revpar 2025

Exponential growth starting the 21st and ending on the 25th
